How to choose the right metal diamond shoe

It is important to understand the different metal bond for different hardness concrete.

- Performance of different grit.

#18/20 for aggressive coating removal.

#25/30 for coarse coating removal.

#30/40 for rough grinding.

#60/80 for medium grinding to remove the scratches from #30/40.

#120/150 for fine grinding to remove the scratches from #60/80.

#250/300 for very fine grinding to save resin diamonds.

- Single segment

More aggressive and increased productivity.

The tool life is shorter.

- Double segment

Reduce the wear rate of the segments.

Smoother scratch pattern.

Reduce the load on the machine.

- You can choose 3 or 4 different steps for grinding job.

It is important to select the suitable metal bond and grit size to optimize efficiency.

Selecting the right metal diamond shoe is a learning process.

You'd better to select medium bond of Quick start segment for your start.

If the wear rate is too fast or hard to grind, you can change the bond of the diamond shoe.

The following guide will be helpful to choose the right metal bond.

Concrete hardness	DUC	DVC	DHC	DMC	DSC	DAC
Ultra hard concrete	●					
Semi-polished concrete	●	○				
Very hard concrete		●	∅	○		
Hard concrete			●	∅	○	
Medium concrete				●	∅	○
Soft concrete					●	∅
